

KLINGER BALLOSTAR® KHI

DN 150 – 1000

KLINGER FLUID CONTROL

Today for tomorrow

As a subsidiary of the KLINGER Group, KLINGER Fluid Control has been developing, manufacturing and maintaining high-quality industrial valves at the business location Gumpoldskirchen/Austria for more than 125 years. Via the global distribution and service network, KLINGER Fluid Control offers both standardized and tailored products, services as well as solutions for customers around the globe.

Products from KLINGER Fluid Control are characterized by their high level of reliability as well as by an above average lifecycle at a simultaneously very low total cost of ownership (TCO). As a solutions partner, KLINGER Fluid Control creates customer benefits with added value. In this regard, the focus is on the following core competences:

ENCOMPASSING SERVICE

- » Application expertise
- » Product trainings
- » Fast quotation and order processing
- » Customer-specific special solutions
- » Supply of spare parts
- » Valve maintenance
- » On-site technical support

INNOVATIVE SOLUTIONS

- » State of the art development tools
- » Product development for different areas of application
- » Customer-specific special solutions
- » Automation solutions
- » Product tests in the company-own technical center
- » A wide range of certificates and approvals

OPERATIONAL EXCELLENCE

- » Flexible production
- » Transparency in the supply chain
- » Short delivery times
- » ISO 9001 certified quality
- » ISO 14001 as well as EMAS certified environmental management system

GUARANTEED DURABILITY

The guarantee for reliability across decades

PRODUCT ADVANTAGES

- » Maintenance-free
- » Certified according to EN 488:2015 (KHSVI VVS)
- » Supports pressurization on both sides
- » Trunnion mounted ball with cylindrical bore
- » Sealing elements protected against water hammers
- » Double block function with bleeding (TÜV-certified)
- » High degree of resilience against pipework forces
- » Subsequent automation possible
(top flange in accordance with EN ISO 5211)

SPECIAL TYPES

- » High temperature version (up to +260 °C)
- » Special design for tunnel boring machines
- » Pre-insulated design for underground installations (KHSVI VVS)
- » Special ball coatings
- » Metal seat for abrasive media
- » Oxygen version
- » Fire Safe version
- » Vacuum version
- » Gas version
- » Oil, grease and silicone-free

PRODUCT DETAILS

PN	16/25/40
DN	150 – 1000 (KHSVI VVS up to DN 800)
Material	Cast steel, stainless steel, further materials upon request
Temperature	-45 °C to +260 °C
Design	Flanges, welding ends, fully welded (KHSVI VVS), reducing cones, full bore
Type	Two-piece ball valve KHI / KHSVI Single-piece ball valve KHSVI VVS

Ballostar® KHI

Two-piece body

Flange ends on both sides

Ballostar® KHSVI

Two-piece body

Welding ends on both sides

Ballostar® KHSVI VVS

Fully welded body

Welding ends on both sides

GREATEST SAFETY

Ballostar® KHI sealing system

Leakages represent the worst case for any plant operator. Negative impacts on the environment as well as downtimes, harm to personnel and assets and in some cases heavy financial losses are just a few of the possible outcomes. A seal, which therefore “practices what it preaches”, i.e. a valve capable of reliably fulfilling its shut-off function, is a must. With the KLINGER Ballostar® KHI, this is ensured in multiple ways: By means of the unique ball valve sealing system and the double block and bleed function.

FUNCTION

Thanks to its "elastic sealing system" the ball valve ensures absolute tightness in combination with both high and low pressures. This is achieved by means of two elastic sealing elements working independent of each other.

As the differential pressure increases, the additional contact forces also increase – the pre-stressed diaphragm springs, which press the sealing rings against the ball, are relaxed and the operating life thus further extended. (Fig. 1)

EFFECT

The sealing system at the ball is pre-stressed during assembly. The two pre-stressed elastic sealing elements made of stainless steel and featuring sealing rings and a back seal (consisting of a U-sleeve and an O-ring) form a system upstream and downstream of the valve together with the ball. Furthermore, a support ring protects the elastic sealing element against overloads, for example caused by water hammers. A wire ring safeguards the sealing unit. (Fig. 2)

The ball valve can be pressurized in both flow directions. The elasticity of the sealing elements allows for a compensation of thermal expansion. Thanks to this function, two primary sealed areas are constantly present in the bore.

Fig. 1

Fig. 2

DOUBLE BLOCK & BLEED

A "Double Block & Bleed" configuration is usually achieved by means of two separate valves. The same effect, however, can be achieved by utilizing a single KLINGER Ballostar® KHI ball valve. Next to saving time and money, this solution is of enormous importance in tight installation fits. With regard to safety and tightness the KLINGER Ballostar® KHI – in comparison to standard "Double Block & Bleed" solutions – convinces in both flow directions, under a wide range of operating conditions and even in a vacuum. Furthermore, pressurization by the medium is not restricted to the surface of the ball of Ballostar® KHI ball valves, but covers the entire sealing element (ball and surface of the diaphragm spring).

Fig. 1

Fig. 2

Fig. 3

Fig. 4

FUNCTION

The open valve (Fig. 1) represents the starting point for the explanation of the function of the Ballostar® KHI: The medium flows through the open ball with the test and drain valve closed. Now the ball valve is closed (Fig. 2), the medium collects in the cavity of the ball valve as a result of the closing process. Draining is achieved by means of opening the test and drain valve (Fig. 3). This configuration state also allows for quick and uncomplicated testing of the function of

the sealing element: The cavity has been drained, the sealing elements ensure the tightness of the valve – additional leakage of the medium is therefore impossible. If required, and as long as the ball valve remains closed and the test and drain valve open (Fig. 4), the pipe section on the medium-free side can now be opened up and/or worked on without hazard.

CERTIFIED QUALITY

The KLINGER Ballostar® KHI lives up to its promises

With regard to its application scope, the KLINGER Ballostar® KHI leaves no questions unanswered. This has been proven by various tests and certifications – for plant operators this means absolute safety in operation with guaranteed tightness.

» EN 488:2019 KHSVI VVS

KLINGER Ballostar® KHSVI VVS ball valves, DN 150 to 800, have been successfully tested and certified by the TÜV Austria under inclusion of the extended requirements of the EN 488:2019.

» Fire Safe

The Fire Safe tests in accordance with API Standard 607, 4th Edition and EN ISO 10497:2004 have been certified by Lloyd's Register and TÜV Austria respectively.

» Approval of the KHI sealing chamber

The KLINGER Ballostar® KHI represents a safe shut-off for the operation of steam boilers in the sense of item 6231 TRD 601 B12.

» Gas approval

ÖVGW Certificate for authorization to display the ÖVGW quality label "Gas" for the ball valves GKHI, GKHSVI and GKHSVI VVS, DN 150 - 800.

» Utilization for gaseous oxygen

The BAM Berlin has granted its approval for the ball valve series Ballostar® KHI in utilization scenarios with gaseous oxygen at operating pressures of up to 16 bar and operating temperatures of up to 60 °C.

» Emission testing in accordance with VDI 2440

Certified emission testing pursuant to VDI 2440 for Ballostar® KHI / KHSVI ball valves at temperatures < 250 °C.

» Pressure Equipment Directive 2014/68/EU

The Ballostar® KHI, KHSVI and KHSVI VVS ball valves are developed, produced, tested and delivered in accordance with the valid standards of the Pressure Equipment Directive 2014/68/EU.

HIGHEST REQUIREMENTS

Certification in accordance with EN 488:2019

In order to increase operational safety, the requirements regarding buried shut-off valves are constantly increased. Meeting these requirements is achieved through the utilization of special valves with particularly rigid and deformation-free bodies. The corresponding technical requirements and test methods for shut-off valves directly buried within district heating networks are defined in the EN 488.

Increased compressive forces as well as new bending moments for valves were already defined in the 2011 predecessor version of the standard. The tensile forces, however, remained unchanged. Compared to 2011, some requirements

have now again been made stricter. The number of operations during the type approval test, for example, has been increased and all tests must be carried out on the same valve. Furthermore, the end of the last 100 mm of the spindle / shaft construction must feature corrosion protection.

KLINGER Ballostar® KHSVI VVS ball valves are successfully tested and certified by the TÜV Austria on the company-own multi-function test stand under inclusion of the expanded re-quirements of EN 488:2019.

BALLOSTAR®

KHI

Flange design, full bore

GENERAL FEATURES

- » 2-piece ball valve with full bore
- » Trunnion mounted ball
- » Bidirectionally sealing
- » High degree of resilience against pipework forces

CONNECTIONS

Flanges in accordance with EN 1092-1 (up to DN 400) and DIN 2544 (from DN 500 upwards)

DIMENSIONS

Face-to-face dimensions in accordance with EN 558, series 12

ACCEPTANCE TESTING

- » Seat leak tightness: EN 12266-1 P12, leakage rate A
- » Tightness to atmosphere: EN 12266-1 P11
- » Strength: EN 12266-1 P10

AUTOMATION

Flange connection in accordance with ISO 5211, allows for direct mounting of an actuator or by means of brackets. Pneumatic and electrical actuators utilizable.

TEMPERATURE

-45 °C to +200 °C (see P-T diagram)

SPECIFIC SOLUTIONS

Underground installation

The KLINGER Ballostar® KHSVI VVS ball valves, certified in accordance with EN 488:2019, are ideally suited for underground installations thanks to their robust design. In this context the ball valves can be, amongst others, enhanced by means of the following options:

- » Top-mounted gear box including position marker with fixed underground installation extension in various lengths
- » Side-mounted gear box with telescopic extension including position marker for simple adaptation to surface
- » Welding ends extended on both sides in accordance with DIN EN 12627 and insulation for plastic-sheathed pipe systems including leakage warning system of choice
- » Various draining / venting extensions with ball valves and insulation

**Shaft extension in various lengths
with mechanical gearbox**

**Gearbox with telescopic extension
for underground installations**

AREAS OF UTILIZATION

Pressure and temperature ranges

The temperatures provided are threshold values that must always be observed in tandem with the medium and the prevailing operating pressure. The permissible continuous temperatures are always within these thresholds.

- 1) Material code X = acid-proof, stainless steel:
Connecting screws 8.8 Fe/Ni 5P (or equivalent)
Material code Xc = all parts made of stainless steel!

TECHNICAL DETAILS

Flow characteristics for the determination of the nominal diameter

Size of ball valve

Flow rate	Q	in m ³ /h
Pressure loss	Δp	in bar
Density	ρ	in kg/m ³
Velocity	w	in m/s
Flow coefficient	K_v	in m ³ /h
Pressure loss coefficient	ζ	

The valve is to be selected in a manner that the K_v -value is greater, or the ζ -value less than the computed value.

Allows for the calculation of:

$$K_v = Q * \sqrt{\frac{\rho}{1000 * \Delta p}}$$

or

$$\zeta = \frac{2 * \Delta p * 10^5}{\rho * w^2}$$

In metric measurement systems the characteristic unit utilized for shut-off and control valves is the K_v -value. The values provided in the table apply to a H₂O flow medium with a temperature of 5-30 °C, a density of 1000 kg/m³ and a pressure loss of $p = 1$ bar at the valve.

In countries using inches, the characteristic unit is the C_v -value. It provides how many US gal/min of H₂O, at a temperature of 60 °F and with a pressure loss of 1 psi, flow through the valve.

$$\Delta p = \zeta * \frac{\rho}{2} * w^2 * 10^{-5}$$

or

$$\Delta p = \left(\frac{Q}{K_v} \right)^2 * \frac{\rho}{1000}$$
